

AUDIT OF UNUSED ACCOUNTS AND DEVICES — MASWER

Client: Maswer (Maswer AG)

Scope: intern.maswer.com domain — all user accounts and all computer objects

Source: read-only LDAP queries against all four domain controllers

Reporting cut-off: 9 September 2026

Prepared by: Sebastian Lazarte Castellon — CoolNetworks

Summary

Maswer's directory contains **322 user accounts** and **513 computer objects**. Of the **241 enabled accounts**, **82 have no recorded logon for more than a year**, or have never recorded one. Of the 512 enabled computer objects, **344 have not been seen for more than a year**, and **282 of those for more than two years**.

However, 82 is not the answer to "how many accounts should be deleted?" When the accounts are separated according to what they actually represent, **only 22 belong to individuals**. The rest are shared mailboxes, department or site accounts, service accounts and administrative accounts: **inactive by design, and deleting them would break services that are running**. Making that distinction is the purpose of this report, and it was missing from the previous review.

Three conclusions for management:

01 — There are 22 individuals with enabled accounts and no activity for more than a year. Twenty of them retain a licensed mailbox, and all twenty-two retain network access through VPN. None can be deprovisioned yet: the directory tells us when an account was last used, never whether the person is still employed.

02 — The previous administrator's credentials remain enabled and in use.

Three of Oliver Orth's accounts show authentication within the last three days, one with domain administrator privileges. This is the issue requiring immediate action, detailed below.

03 — Two thirds of the computer inventory consists of stale directory objects.

There are 344 obsolete objects, including six servers that have already been replaced and ten machines with unsupported operating systems. Cleaning them up will not save licences, but it will reduce the attack surface and restore a trustworthy inventory.

Background

This review did not originate from a ticket. It arose from two outstanding issues:

- The Jewgenij Schachow offboarding case (2 September) exposed the pattern and left a written recommendation that had not been implemented: of 217

accounts with VPN access, 64 were enabled with no logon in 90 days, and the oldest dated back to 2020.

- Preparations for the ISO 27001 and ENS audit still include an outstanding corrective action: a periodic access review that is "completed and dated", together with the requirement that no former employees retain an active licence.

There is also a date that determines the financial implications: **Microsoft 365 Business Premium and Basic subscriptions renew on 17 September 2026.** Microsoft's contracting rules only allow seat counts to be reduced at renewal; outside that window, any surplus seats remain committed for another twelve months.

Key environment facts

Item	Value
Domain	intern.maswer.com (NetBIOS MASWER), single forest and single domain
Domain controllers	MDERZADC003, MDERZADC004 (Frankfurt), MEUAZDC011 (Azure EU), MUSAZDC011 (Azure US)
Hybrid identity	Synchronisation to Microsoft 365 from MEUAZAC011, pass-through authentication
User accounts	322 objects — 241 enabled, 81 disabled
Computer objects	513 objects — 512 enabled, 1 disabled
Base licensing	Microsoft 365 Business — 218 seats purchased, 180 assigned (export dated 31 Aug 2026)

Method and calculation basis

What was queried. The lastLogon and lastLogonTimestamp attributes of every account and computer were queried on **all four** domain controllers, retaining the most recent date from the four. All queries were read-only LDAP queries: no object was modified, disabled or deleted.

Why all four, rather than just one. lastLogon is not replicated between controllers, and the Azure controllers replicate in a chain rather than a mesh. Querying just one produces false "inactive" results: a documented example showed an account as active on 27 August on MDERZADC003, while MUSAZDC011 still showed February. The comparison confirms the effect: querying a single controller produced 83 unused accounts and 345 unused computers; querying all four reduced those figures to 82 and 344.

Thresholds. The population is divided into less than 90 days, 90 to 180 days, 180 days to one year, one to two years, more than two years, and no recorded logon. The **one-year** threshold is used for the headline figure.

What is verified and what is not.

- **Verified:** whether the account is enabled, its organisational unit, mailbox type, group memberships and most recent authentication date.

- **Not verified:** whether the person has left the company. The directory does not know. Logon activity alone can mistake maternity leave, sick leave, extended leave and occasionally used accounts for abandoned accounts.
- **What would resolve this:** the HR list of active employees. Only Maswer can fill in that column.

A margin to bear in mind. lastLogonTimestamp is replicated with a delay of up to 14 days, so dates may lag by that amount. This is immaterial for a one-year threshold, but matters if the threshold is ever reduced to 30 days.

How each account is classified. The main criterion is the mailbox type assigned by the directory, rather than the name. A user mailbox indicates an individual or a licensed seat; a shared mailbox never represents an individual; no mailbox indicates a technical account. Names are used only to distinguish individuals from department accounts within the first group, using an explicit list that can be reviewed.

User accounts

Overview by time since last logon

Of the 241 enabled accounts:

Time since last logon	Accounts
Less than 90 days	128
90 to 180 days	16
180 days to 1 year	15
1 to 2 years	22
More than 2 years	26
No recorded logon	34
Total unused for more than a year	82

The breakdown that changes the answer

The 82 unused accounts do not represent 82 leavers. Broken down by what they actually are:

Account type	Enabled	Unused > 1 year	Can be deprovisioned
Individual	161	23	Yes, after confirmation from Maswer
Department, role or site	20	19	Not without checking: these accounts are used occasionally
Shared mailbox	16	13	No: these are correctly processed leavers
Service and technical	15	11	Only after identifying what uses them
Administrative	18	7	Yes, as a priority — see the dedicated section
System and Exchange	11	9	No: managed by the product itself
Total	241	82	

Of the 23 unused individual accounts, **one was created yesterday and has not yet been used** (Erik Esau Guillermo Valencia, created on 8 September). This is not a leaver. That leaves **22 actual candidates**.

The 13 accounts in the "shared mailbox" row deserve a positive note: most belong to former employees whose mailboxes were converted to shared mailboxes when they left. This is exactly the correct treatment and confirms that the offboarding procedure works when applied.

The 22 individual candidates

None of these accounts is being deprovisioned through this report. Maswer must complete the right-hand column.

Account	Name	Last logon	Days	Site	Licence	VPN	Still in use? / confirmed by
RGallardo	Rocio del Carmen Gallardo Villanueva	2024-05-07	855	Puebla	Yes	Yes	
CKnoll	Christoph Knoll	2024-10-11	698	Tuscaloosa	Yes	Yes	
VVega	Virginia Vega Nieto	2024-10-15	694	Zaragoza	Yes	Yes	
ERamirez	Eduardo Isaac Ramirez Sanchez	2025-02-04	582	Puebla	Yes	Yes	
KBillingsley	Keambria Billingsley	2025-03-06	552	Tuscaloosa	Yes	Yes	
LMendoza	Luis Alberto Mendoza Jaimes	2025-04-28	499	Puebla	Yes	Yes	
LLopez1	Leopoldo Lucero Lopez	2025-05-22	475	Puebla	Yes	Yes	
AGarcia	Adriana Garcia Medina	2025-06-11	455	San Luis Potosí	Yes	Yes	
MInal	Mehmet Inal	2025-06-25	441	Rüsselsheim	Yes	Yes	
IJuarez	Isaias Juarez Andrade	2025-06-26	440	Aguascalientes	Yes	Yes	
ELuna	Erik Joel De Luna Gómez	2025-07-10	426	Aguascalientes	Yes	Yes	
GVerdad	Gerardo Verdad	2025-07-16	420	Puebla	No	Yes	
IMartinez	Ilse Martinez	2025-08-15	389	Aguascalientes	Yes	Yes

JTeomitzi	Jose Eulalio Teomitzi Carbajal	Never	—	Puebla	Yes	Yes	
JSoriano	Jessica Soriano Trujillo	Never	—	Puebla	Yes	Yes	
JRosales	Jose Alfredo Rosales Lozano	Never	—	Puebla	Yes	Yes	
DEspinosa	Dulce Espinosa	Never	—	Puebla	Yes	Yes	
IChakrane	Ibtissam Chakrane	Never	—	Zaragoza	Yes	Yes	
GRosales	Cristian Gabriel Rosales Arellano	Never	—	Aguascalientes	Yes	Yes	
NDCMarques	Niklas da Costa Marques	Never	—	Vaihingen	Yes	Yes	
AdVita	Alessio di Vita	Never	—	Vaihingen	Yes	Yes	

Two patterns should be highlighted to Maswer:

- **Eight accounts have never been used**, and they are not recent: three were created in April 2024 and two in December 2025. An account that is never used usually means that the person never actually joined, or works without a computer. If the former applies, the licence has been paid for since the account was created.
- **The concentration is geographical.** Fourteen of the twenty-two are in Mexico and three in the United States. Only three are in Germany and two in Spain. This suggests that leaver notifications from the sites in the Americas are not reaching the support service.

Accounts that must NOT be treated as leavers

Nineteen department, role or site accounts show no use for more than a year, and eighteen consume a licence: Finanzas MX, Compras MX, Purchasing USA, Payroll USA, Finance USA, HR Connect, Quejas Sugerencias, Team Leader, Team Leader USA, Tech Reporting2 MBUSI, Transporte Saltillo, IT Support AM, Social Networks, ADMIN VISADOS, CR Zaragoza2, Gößnitz, Hemau, PMX 001 and replay.

These are not leavers, but **they are not free either**. Each is a paid seat that nobody opens. The right question is not "who was this?" but "is this mailbox still needed, and who is responsible for it?"

Eleven service accounts have not authenticated for more than a year, five of them for more than five years: AAD_1f80425d3c6a (2016), LDAP_Service2 (2016), swyx (2020), LDAP_Service (2021) and LDAP LDAP (2023), plus ldap-maswer and ldap-service, which have never been used. These are remnants of retired integrations.

Before changing any of them, the process that used it must be identified, not afterwards.

Privileged accounts — the finding that requires action

The domain has **18 enabled administrative accounts**. Seven have not been used for more than a year:

Account	Owner	Last logon	Days unused
tplink	Device account, direct member of Domain Admins	2017-03-01	3,479
admin	Generic	2017-03-01	3,479
admadfs	ADFS service	2020-12-08	2,100
Admin2_MR Garcia	Miguel Rubira Garcia	2021-01-07	2,071
Administrator1_OOrth	Oliver Orth	2021-02-10	2,037
adm0_conet	Conet Admin	2025-01-13	604
Administrator0_OOrth	Oliver Orth	2025-05-27	470

In the case of tplink, nine years of inactivity with domain administrator privileges.

What changes the picture is what is still being used. Until now, it had not been checked whether the previous administrator's accounts were active or merely still present. This has now been verified:

Oliver Orth account	Status	Last logon	Privilege
oorth (standard account)	Enabled	2026-09-08, on three controllers	18 data access groups, VPN, Backup Operators
Admin2_OOrth	Enabled	2026-09-08, on all four controllers	adm2-Administrators
Admin1_OOrth	Enabled	2026-09-06	Domain's Administrators group, AzureFiles-Administrators
Administrator0_OOrth	Enabled	2025-05-27	adm0-Administrators, effective Domain Admins privileges
Administrator1_OOrth	Enabled	2021-02-10	adm1-Administrators

Verified: the first three have authenticated within the last three days, and Admin1_OOrth belongs to the domain's Administrators group.

Inferred, not confirmed: that these accounts are not being used by a person. Admin2_OOrth records logons **at exactly 12:10 on all four controllers**, on different dates. That regularity is characteristic of a scheduled task or service, rather than someone entering a password.

What is unknown: which process it is, which machine it runs on and what logon type it uses. Only the domain controllers' security logs (events 4624 and 4768) can establish this, by filtering for these accounts and examining the source computer and logon type.

Why this matters either way. Whether used by a person or a process, credentials belonging to an administrator who no longer works for the company are actively in use today. This has an immediate practical consequence: **simply disabling them would break whatever is using them.** The correct order is therefore to identify first and disable afterwards, never the reverse.

An additional finding answers an outstanding question: a shared mailbox in Oliver Orth's name was created on **1 October 2025**. Converting a mailbox to shared is what happens when someone leaves, so this is very likely to be his departure date.

Devices

Overview

Time since last seen	Computers
Less than 90 days	109
90 to 180 days	23
180 days to 1 year	36
1 to 2 years	59
More than 2 years	282
No record at all	3
Total not seen for more than a year	344

Only **168 of 512 computers have shown activity in the last year**. The breakdown by year of last contact shows an accumulation over a decade rather than a recent spike: 6 computers were last seen in 2016, 16 in 2017, 17 in 2018, 29 in 2019, 28 in 2020, 49 in 2021, 49 in 2022, 53 in 2023, 51 in 2024 and 43 in 2025.

Replaced servers still present in the directory

Server	System	Last contact
MDERZADC001	Windows Server 2012 R2	2023-11-21
MDERZADC002	Windows Server 2012 R2	2023-11-21
MEUAZDC001	Windows Server 2012 R2	2023-11-13
MEUAZPTA001	Windows Server 2019	2023-05-26
MEUAZPTA002	Windows Server 2019	2023-05-24
MDERZAXX03	Windows Server 2012 R2	2021-08-31

These are the predecessors of the domain controllers and authentication agents now in service with identifiers ending in 003, 004 and 011. The migration was completed; the directory clean-up was not.

Unsupported operating systems

Ten obsolete computers run systems that no longer receive security updates: five Windows 8.1 machines in Barcelona and Zaragoza, four Windows Server 2012 R2 machines (those in the preceding table), and one Windows 7 machine (XEROXFBH, with no contact since January 2017). None has been seen for years, so they most likely no longer exist physically. Confirming this closes an audit finding at no cost.

Computers that do not follow the corporate naming convention

Fifteen objects do not follow the site-and-number pattern: MAGDA, MASWER-SBUESA, LAPTOP-B33DD389, LAPTOP-BISDDK0P, XEROXFBH, mwsgeu1premium,

mwsgus2premium, mwsgus3premium and seven others with mixed prefixes. This is the same pattern as the OORTH laptop: computers reassigned or provisioned outside the procedure that were never renamed. Each represents a computer whose current owner is not recorded anywhere.

A warning before clean-up

The **AZUREADSSOACC** object has no recorded logons and must not be **changed**. This is the account that enables automatic sign-in to Microsoft 365 for the entire workforce. By design, it never signs in. Deleting it because it "has been inactive for five years" would leave all users without seamless access to Microsoft 365. It is the clearest example of why "inactive means delete" cannot be applied automatically.

Licensing impact

There are **218 user mailboxes** in the directory: 171 on enabled accounts and **47 on accounts that are already disabled**. Maswer has purchased exactly **218 Microsoft 365 Business seats**, of which 180 were shown as assigned in the latest available billing extract, dated 31 August.

The match between these figures is striking and **must not be accepted without verification**: a disabled account retaining its mailbox in the directory does not prove that it still has an assigned Microsoft 365 licence. The portal's billing extract establishes that, not the directory.

With that qualification, the scope for review before renewal is:

Item	Seats
Difference between purchased and assigned seats (31 Aug)	38
Disabled accounts retaining a user mailbox	47
Enabled, licensed accounts unused for more than a year	40
— of which, individuals	21
— of which, department or site accounts	18
— of which, technical accounts	1

The window closes on 17 September. The task is not to decide within eight days what to deprovision: it is to decide within eight days **how many seats to renew**, which is a number rather than a list. Everything else can continue afterwards.

One qualification has already caused a support case: **do not remove the licence from a mailbox that someone else has taken over**. If a successor is using the mailbox of someone who has left, the correct approach is to convert it to a shared mailbox, rather than release the seat.

What this report cannot answer

The question "which users left Maswer more than a year ago" **cannot be answered from the systems**. This report provides the closest available information: a list of those who have not used their accounts, with names, dates and sites. Only Maswer can confirm who is still employed.

Three specific gaps, and who can close them:

- **HR's list of active employees.** Request it through Vincenzo Valle. No implementation date can be committed to without it.
- **Actual Microsoft 365 activity.** Someone who only uses email on a mobile phone or in a browser may appear inactive in the directory while working normally. The admin centre usage report can disprove that apparent inactivity immediately, and it must be cross-checked before any list of named individuals is sent.
- **Who uses each computer.** The directory shows when a machine was last seen, never who has it. Only the client can complete that column.

Deprovisioning plan

Nothing is deleted. Accounts are disabled and retained, and no change is made without written management authorisation attached to the ticket, with a date and sender. Deleting an account also deletes its mailbox and files and cannot be undone.

1. Close the exposure from privileged accounts

Use the controllers' security logs to identify what is using Oliver Orth's accounts, disable all five once the process has been identified and replaced, and rotate the passwords of the shared and service accounts he knew. Disable tmlink and admin, unused since 2017.

- **Benefit:** closes administrator-level access belonging to an employee who has left.
- **Scope:** five *OOrth accounts, plus tmlink, admin, admads and Admin2_MRGarcia.
- **Service impact:** none if the process is identified first; disruption to that process if the order is reversed. This is why the sequence is non-negotiable.
- **Coordination:** conet.de also knows the shared and service accounts; password rotation must be agreed with them.

2. Request the list of active employees

Ask Maswer, through Vincenzo Valle, for the list of current employees and cross-check it against the 22 candidates in this report.

- **Benefit:** turns a list of inactive accounts into a list of confirmed leavers.
- **Service impact:** none.

3. One confirmation round with a single deadline

Send the tables in this report as a confirmation sheet, leaving the "Still in use? / confirmed by" column blank, with **one shared deadline** for all groups: individuals, department accounts, service accounts and computers. Silence at the deadline is not approval: accounts remain disabled and the matter stays open until written confirmation arrives.

- **Benefit:** a single point of coordination instead of chasing separate responses.
- **Service impact:** none.

4. Decide the seat count before 17 September

Cross-check the updated billing extract against the 47 disabled accounts that retain mailboxes, and agree with conet.de (Patrick Kuhlmann) how many seats to renew. Before releasing any, verify what the Microsoft 365 backup actually retains.

- **Benefit:** avoids committing to another twelve months of seats that nobody uses.
- **Service impact:** none, provided no mailbox taken over by a successor is affected.

5. Clean up the computer inventory

First retire the six replaced servers and the ten computers with unsupported operating systems, after confirming that they no longer exist physically. Then address the 282 objects with no contact for more than two years. Exclude AZUREADSSOACC.

- **Benefit:** a trustworthy inventory and a smaller attack surface.
- **Service impact:** none for computers that no longer exist.

6. Close the gap that caused the accumulation

The concentration of inactive accounts in Mexico and the United States indicates that leaver notifications from those sites are not reaching support. Agreeing a leaver notification process for each site with Maswer will prevent this audit from needing to be repeated in a year's time.

- **Benefit:** prevents the problem from recurring.
- **Service impact:** none.

Action summary

#	Action	Benefit	Service impact
1	Identify and disable the previous administrator's accounts	Closes active privileged access	None if identified first
2	Request the list of active employees via Vincenzo Valle	Enables decisions on confirmed leavers	None
3	Confirmation sheet with a single deadline	One round instead of several	None
4	Set the seat count for renewal before 17 Sep	Avoids 12 months of unused seats	None
5	Retire replaced servers and unsupported computers	Reliable inventory, smaller attack surface	None
6	Leaver notifications from sites in the Americas	Prevents recurrence	None

Assessment

Item	Status
Data loss	None
Changes made to the directory	None — read-only audit
Accounts disabled or deleted in this review	None
Confirmed security incident	No
Open security exposure	Yes — previous administrator's credentials in use
Service interruption	None

The directory reflects a company that has grown and changed administrators without access removal keeping pace with account creation. There is no evidence of misuse, and none of the findings points to an attack. What exists is a ten-year accumulation that reduces inventory reliability and leaves more access paths open than necessary.

The previous administrator's accounts are the issue that cannot wait. The rest is routine housekeeping, to be addressed through a well-organised confirmation round and a deadline.

Appendix — data scope

The complete account-by-account and computer-by-computer list, including last logon, organisational unit, mailbox type, groups and VPN membership, is available as a data file to attach to the confirmation sheet. This document includes the 22 individual account candidates and the priority subsets of computers; the complete list of 344 computer objects is not reproduced here because of its length.

Document prepared by CoolNetworks · 9 September 2026.
